### Shutdown control

The ON/OFF pin provides several features for adjusting and sequencing the power supply, a user has the flexibility of using the ON/OFF pin as:

1) A digital on/off control by pulling down the ON/OFF pin with an open-drain transistor.

2) Line UVLO. If desired to achieve a UVLO voltage, an resistor divider from  $V_{in}$  to ON/OFF to GND can be used to disable the converter until a higher input voltage is achieved. For example, it is not useful for a converter with 12V output to start up with a 12V input voltage, as the output cannot reach regulation. To enable the converter when the input voltage reaches 14V, a 51k $\Omega$ /5k $\Omega$  resistor divider from  $V_{in}$  to GND can be connected to the ON/OFF pin. Both the precision 1.25V threshold and 150mV hysteresis are multiplied by the resistor ratio, providing a proportional 12% hysteresis for any startup threshold. So, the turn off threshold would be between 12.3V to 15.7V.

3) Power supply sequencing. By connecting a small capacitor from ON/OFF to GND, the 2 $\mu$ A current source and 1.25V threshold can provide a stable and predictable delay between startup of multiple power supplies. For example, a startup delay of roughly 64mS is provided using 100nF, and roughly 136mS by using 200nF.

CH1: Vin/off  
CH2: Vo  
Delay time: 64mS

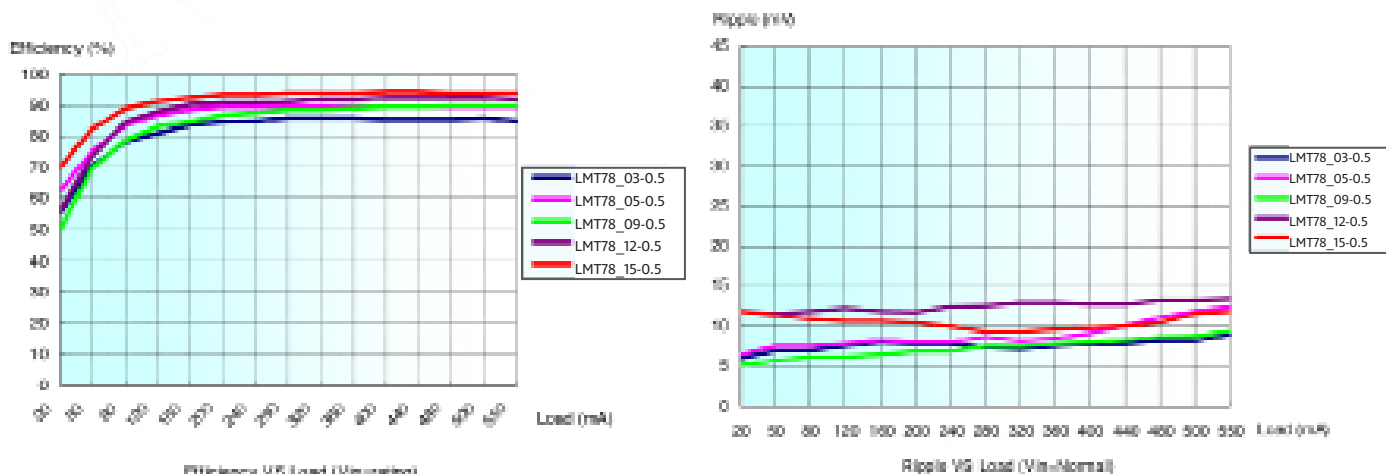

CH1: Vin/off  
CH2: Vo  
Delay time: 136mS
